

TIME2GRAZE

Roadmap session

Connecting country pathways with the remote sensing timeline

Goiânia, Brazil | 17 September 2026

Agenda

1

Future project directions

Santiago

2

Roadmap activity

Country and remote sensing timelines

3

Wrap-up, if time

Unresolved questions or progress on Tuesday's workshop questions

Remote sensing team roles and responsibilities

Data production and access

Develop the methods for near-real-time productivity and biomass estimates, including a peer-reviewed methods paper

Build and operate the data production pipeline

Publish well-documented data and work with tool developers on access

Field data and regional customization

Create an in-situ database with variables needed for customization, including LUE, GPP and biomass

Maintain the Field Data Mobilization Plan and align country protocols with production needs

Work with country partners to test usability, tailor the data where feasible, and provide clear regional guidance

Our current GMH grant ends in July 2027. Activities requiring intensive remote sensing support after then depend on future funding and team capacity.

Roadmap activity

Goal: Find the dependencies and collaboration points between the country pathways and the remote sensing timeline

- 1 Sit with your country or remote sensing team**
- 2 Use your Roadmap to First Use worksheet from Bea's session**
- 3 One person stays with the roadmap while the other rotates**

Transfer the major milestones to sticky notes and place them on the timeline. The remote sensing team uses green sticky notes.

Use the conversations to check timing, dependencies and where the teams need to work together.

Revise the roadmap as you talk. Mark anything that remains unresolved.

Important unresolved questions

Add priority questions from Bea's session here

Workshop progress

Looking back at Tuesday's workshop questions

What have we answered or clarified?

What still needs attention after the workshop?

What should become a concrete follow-up action?
